The Ozonator System

Price: \$400.00

- Sanitizing system that automatically eliminates bacteria and germs from the water lines and pump & motor.
- When the probes detect water in the bathtub, the O3 system automatically activates the waiting mode until the bathtub is emptied.
- Once the O3 system has detected an absence of water, the O3 system turns on a (1) hour delay timer. The O3 system will then start the cleaning process for period of (15) minutes to sanitize the whirlpool piping and/ or the air channel.
- (30) Seconds before the end of the cleaning cycle, the O3 system will turn off the ozone generator and only the air compressor will continue to function. Doing so, the ozone gas that is left within the module will be emptied thus will prevent corrosion of the system components.
- When the sanitization cycle is finished, the O3 system will automatically turn off until water detection occurs within the bathtub.
- An electric keypad accessible from the inside and the outside of the bathtub will permit the user to turn off the sanitizing process at any time. However, for security reasons, he will not be able to start the system manually.
- It is the system that we are sanitization, not the bather! The majority of the ozonators available on the market function with the venture effect of the whirlpool pump to inject the ozone within the system. Therefore, the bathtub must be full of water and the whirlpool system must be in function. The ozone that is injected within the system loses most of its efficiency for the sanitization of the piping of the whirlpool system because the majority of the ozone concentration is used to sanitize the bath water. Furthermore, a venture system is incapable of generating as much concentration of ozone as with a compressor system.
- Maintenance free system.

The Ozonator System can be added to all whirlpool tubs or The Diamond Elite plus Walk in Tub
